

Power Outage

If you live in a new or recently renovated building, your apartment likely uses circuit breakers. Power can be interrupted if the electrical system is overloaded.

- **First**, identify and fix the cause of the overload.
- **Then**, reset the circuit breaker by flipping the switch that has tripped.

Many apartments also have a **ground fault circuit interrupter (GFCI)**. It cuts the power if it detects a fault in the system. If your apartment loses power:

1. **Unplug the last device you connected.**
2. **Reset the GFCI** by flipping the switch back up.

If this doesn't work, or if your entire apartment remains without power, contact ByggVesta for service.
